Bad news

Math olympiad coaching is such a small world that most things are not written anywhere obvious, if at all.

About this sphere

Bad news

Math olympiad coaching is such a small world that most things are not written anywhere obvious, if at all.

Examples of *oral traditions*:

- No official syllabus of IMO topics exists (unlike IOI).
- Haphazard voting process for problem selection.
- How IMO coordination works (e.g. past rubrics).
- What the IMO Shortlist is and how to use it.
- <https://aops.com/community/c13>

About this sphere

Bad news

Math olympiad coaching is such a small world that most things are not written anywhere obvious, if at all.

Examples of *oral traditions*:

- No official syllabus of IMO topics exists (unlike IOI).
- Haphazard voting process for problem selection.
- How IMO coordination works (e.g. past rubrics).
- What the IMO Shortlist is and how to use it.

Good news

Most coaches are really nice and you should talk to them.

Two key ingredients

I would say the **two most important things** are:

- Excellent problems and solutions on national competitions (at all levels).
- Building and nurturing a community of students and trainers.

Problems and solutions

These are the raw materials used by students

- Quality of MO's sets it apart from other extracurriculars.
 - Why MO medalists are heavily recruited.
- Good authors and editors are so valuable that money can't buy them.
- For full pyramid, not just the final round.
 - Develops a talent base, not just top-6 IMO squad.

Problems and solutions

These are the raw materials used by students

- Quality of MO's sets it apart from other extracurriculars.
 - Why MO medalists are heavily recruited.
- Good authors and editors are so valuable that money can't buy them.
- For full pyramid, not just the final round.
 - Develops a talent base, not just top-6 IMO squad.

Example: USA problem process

- <https://web.evanchen.cc/problems.html>
- Each TST had 6-month selection and review.
- The earlier round AMC/AIME has 2-year review.

Where to find problems

If your system isn't super-mature, it's likely unrealistic to create many original problems, especially at IMO level.

Where to find problems

If your system isn't super-mature, it's likely unrealistic to create many original problems, especially at IMO level.

IMO Shortlist

- Shared resource of 24+ problems a year.
- Security issue, but best-written solutions in town.

Where to find problems

If your system isn't super-mature, it's likely unrealistic to create many original problems, especially at IMO level.

IMO Shortlist

- Shared resource of 24+ problems a year.
- Security issue, but best-written solutions in town.

AoPS contest index

<https://aops.com/community/c13>

The screenshot shows two panels of contest links from the AoPS website. The left panel is titled 'International Contests' and lists: IMO (International Math Olympiad), IMO Longlists, Austrian-Polish, Balkan MO Shortlist, Benelux, IMO Shortlist, APMO, Balkan MO, Baltic Way, and Causcous Mathematical Olympiad. The right panel is titled 'National and Regional Contests' and lists: Kazakhstan Contests, Korea Contests, Kyrgyzstan Contests, Lithuania Contests, Malaysia Contests, Moldova Contests, Kazakhstan Contests from Kazakhstan, Kosovo Contests, Latvia Contests, Lusophon Mathematical Olympiad, Mexico Contests, and Mongolia Contests.

Where to find problems

If your system isn't super-mature, it's likely unrealistic to create many original problems, especially at IMO level.

IMO Shortlist

- Shared resource of 24+ problems a year.
- Security issue, but best-written solutions in town.

Collaboration

Example: mirrored contests (e.g. RMM, APMO).

Community

Building a community out of common interests at all levels is super important for talent base.

Goals of the human component

- Peers to be role models and friends with.
- Space to ask questions, talk about problems, etc.
- Feedback cycle where top students return as trainers and problem proposers (reaching escape velocity).

Community

Building a community out of common interests at all levels is super important for talent base.

Goals of the human component

- Peers to be role models and friends with.
- Space to ask questions, talk about problems, etc.
- Feedback cycle where top students return as trainers and problem proposers (reaching escape velocity).

Figure out what students already use and connect them

So far...

Two stated end-goals

- Great problems at all levels build a deep talent base.
- Foster active community based on shared interests.

How do we get there?

So far...

Two stated end-goals

- Great problems at all levels build a deep talent base.
- Foster active community based on shared interests.

How do we get there?

Spoiler

- It's really hard! (That's why it's interesting.)
- Probably no "magic bullet" or one-size-fits-all answer.
- Rather than try to describe a recipe, some general advice by showing examples of mistakes I've made.

Process

The most competent people, with weak processes, will screw up.

— Chris Peterson

Theory and practice sometimes clash. And when that happens, theory loses. Every single time.

— Linus Torvalds

- For both goals, pay attention to infrastructure/process.
- Processes must work well in practice, not just in theory.

Example #1: college homework model

Failure mode

- Used to just send students a PDF of 7 problems, ask to solve all of them, and email whenever stuck.
- Led to **enormous friction** whenever student couldn't solve a problem (often).
 - Would often give up on problem or feel discouraged
 - Unrealistic **in practice** to expect someone to email Evan every single time they can't solve a problem, even if it's possible **in theory**.

Example #1: college homework model

Failure mode

- Used to just send students a PDF of 7 problems, ask to solve all of them, and email whenever stuck.
- Led to **enormous friction** whenever student couldn't solve a problem (often).
 - Would often give up on problem or feel discouraged
 - Unrealistic **in practice** to expect someone to email Evan every single time they can't solve a problem, even if it's possible **in theory**.

Resolution

- **Point-based problem sets**, solve any $\binom{n}{7}$ or so.
- Large Discord community of peers for discussion.
- Automated pre-written hint system.

Example #2: USA TST 2014-2017

Failure mode

- Haphazard email thread for both proposals and rating, with no solutions at all.
- No process to get consensus or organize feedback.
- Unrealistic **in practice** to expect everyone to follow a lot of emails, even if it's possible **in theory**.

Example #2: USA TST 2014-2017

Failure mode

- Haphazard email thread for both proposals and rating, with no solutions at all.
- No process to get consensus or organize feedback.
- Unrealistic **in practice** to expect everyone to follow a lot of emails, even if it's possible **in theory**.

Resolution

- Created mailing list with clear schedule ahead of time (submit problems by X, ratings by Y, test chosen by Z).
- Proposals collated in packet with full solutions.
- Google form to aggregate all ratings and feedback.
