## Problem

A finite set $S$ of points in the coordinate plane is called overdetermined if $|S| \geq 2$ and there exists a nonzero polynomial $P(t)$, with real coefficients and of degree at most $|S|-2$, satisfying $P(x)=y$ for every point $(x, y) \in S$.

For each integer $n \geq 2$, find the largest integer $k$ (in terms of $n$ ) such that there exists a set of $n$ distinct points that is not overdetermined, but has $k$ overdetermined subsets.

## Solution

We claim the answer is $k=2^{n-1}-n$. We denote the $n$ points by $A$.
Throughout the solution we will repeatedly use the following fact:
Lemma. If $S$ is a finite set of points in the plane there is at most one polynomial with real coefficients and of degree at most $|S|-1$ whose graph passes through all points of $S$.

Proof. If any two of the points have the same $x$-coordinate then obviously no such polynomial may exist at all.

Otherwise, suppose $f$ and $g$ are two such polynomials. Then $f-g$ has degree at most $|S|-1$, but it has $|S|$ roots, so is the zero polynomial.

Remark. Actually Lagrange interpolation implies that such a polynomial exists as long as all the $x$-coordinates are different!

Construction: Consider the set $A=\{(1, a),(2, b),(3, b),(4, b), \ldots,(n, b)\}$, where $a$ and $b$ are two distinct nonzero real numbers. Any subset of the latter $n-1$ points with at least one element is overdetermined, and there are $2^{n-1}-n$ such sets.

Bound: Say a subset $S$ of $A$ is flooded if it is not overdetermined. For brevity, an $m$-set refers simply to a subset of $A$ with $m$ elements.
Claim. If $S$ is an flooded $m$-set for $m \geq 3$, then at most one ( $m-1$ )-subset of $S$ is not flooded.

Proof. Let $S=\left\{p_{1}, \ldots, p_{m}\right\}$ be flooded. Assume for contradiction that $S-\left\{p_{i}\right\}$ and $S-\left\{p_{j}\right\}$ are both overdetermined. Then we can find polynomials $f$ and $g$ of degree at most $m-3$ passing through $S-\left\{p_{i}\right\}$ and $S-\left\{p_{j}\right\}$, respectively.

Since $f$ and $g$ agree on $S-\left\{p_{i}, p_{j}\right\}$, which has $m-2$ elements, by the lemma we have $f=g$. Thus this common polynomial (actually of degree at most $m-3$ ) witnesses that $S$ is overdetermined, which is a contradiction.

Claim. For all $m=2,3, \ldots, n$ there are at least $\binom{n-1}{m-1}$ flooded $m$-sets of $A$.
Proof. The proof is by downwards induction on $m$. The base case $m=n$ is by assumption.
For the inductive step, suppose it's true for $m$. Each of the $\binom{n-1}{m-1}$ flooded $m$-sets has at least $m-1$ flooded ( $m-1$ )-subsets. Meanwhile, each $(m-1)$-set has exactly $n-(m-1)$ parent $m$-sets. We conclude the number of flooded sets of size $m-1$ is at least

$$
\frac{m-1}{n-(m-1)}\binom{n-1}{m-1}=\binom{n-1}{m-2}
$$

as desired.
This final claim completes the proof, since it shows there are at most

$$
\sum_{m=2}^{n}\left(\binom{n}{m}-\binom{n-1}{m-1}\right)=2^{n-1}-n
$$

overdetermined sets, as desired.
Remark (On repeated $x$-coordinates). Suppose $A$ has two points $p$ and $q$ with repeated $x$ coordinates. We can argue directly that $A$ satisfies the bound. Indeed, any overdetermined set contains at most one of $p$ and $q$. Moreover, given $S \subseteq A-\{p, q\}$, if $S \cup\{p\}$ is overdetermined then $S \cup\{q\}$ is not, and vice-versa. (Recall that overdetermined sets always have distinct $x$-coordinates.) This gives a bound $\left[2^{n-2}-(n-2)-1\right]+\left[2^{n-2}-1\right]=$ $2^{n-1}-n$ already.

Remark (Alex Zhai). An alternative approach to the double-counting argument is to show that any overdetermined $m$-set has an flooded $m$-superset. Together with the first claim, this lets us pair overdetermined sets in a way that implies the bound.
