TWITCH SOLVES ISL

Episode 29

Problem

Let $ABCD$ be a cyclic quadrilateral inscribed in a circle with center O . Points M and N are the midpoints of \overline{BC} and \overline{CD} , and points E and F lie on AB and AD respectively such that EF passes through O and $EO = OF$. Lines EN meet FM at P . Let S denote the circumcenter of $\triangle PEF$. Line PO intersects AD and BA at Q and R respectively. Suppose $OSPC$ is a parallelogram. Prove that $AQ = AR$.

Solution

We let H denote the orthocenter of $\triangle PEF$.

Let ω denote the circle with diameter \overline{OC} , passing through M and N .

Claim. The circle ω is the nine-point circle of $\triangle PEF$ (or $\triangle HEF$ if you prefer).

Proof. We observe a few facts:

- Clearly ω has radius half that of (O) . Since $SP = OC$, the circles (S) and (S) are congruent, hence the radius of ω is half that of (PEF) too.
- Point O is the midpoint of \overline{EF} ,
- The antipode of O — namely C — is known to lie on the P -altitude (because $\overline{SO} \perp \overline{CP}$ and $\overline{SO} \parallel \overline{EF}$). \square

Claim. \overline{AC} bisects $\angle BAD$.

Proof. We have $OM = ON$, so $BC = CD$. \square

Claim. We have $\overline{CA} \parallel \overline{OP}$.

Proof. From $ABCD$ is cyclic, we can compute

$$\angle EAF = \angle BAD = \angle BCD = \angle MCN = \angle MON = 2\angle FHE$$

so A lies on the circle through E , F , and the circumcenter of $\triangle HEF$. Denote this circumcenter by W . As $WE = WF$, so this implies \overline{AW} bisects $\angle EAF$, and hence AWC are collinear. Since $OWCP$ is a parallelogram, this completes the proof. \square

This completes the solution.
