Episode 87

## Problem

Consider an acute-angled triangle $A B C$, with $A C>A B$, and let $\Gamma$ be its circumcircle. Let $E$ and $F$ be the midpoints of the sides $A C$ and $A B$, respectively. The circumcircle of the triangle $C E F$ and $\Gamma$ meet at $X$ and $C$, with $X \neq C$. The line $B X$ and the tangent to $\Gamma$ through $A$ meet at $Y$. Let $P$ be the point on segment $A B$ so that $Y P=Y A$, with $P \neq A$, and let $Q$ be the point where $A B$ and the parallel to $B C$ through $Y$ meet each other. Show that $F$ is the midpoint of $P Q$.

## Solution

Let $T=\overline{A A} \cap \overline{B C}$.

Claim (Main claim).

$$
\frac{A X}{B X}=\frac{A T}{A B} .
$$

Proof. Let $A^{\prime}$ denote the point such that $A B C A^{\prime}$ is an isosceles trapezoid with $A A^{\prime} \| B C$. Note that $A^{\prime}$ lies on line $F X$, because $\measuredangle C X F=\measuredangle C E F=\measuredangle A E F=\measuredangle A C B$.

Now let $Z$ be the harmonic conjugate of $X$ with respect to $A B$. Projecting $A X B Z$ through $A^{\prime}$ onto line $A B$ we find $\overline{A^{\prime} Z} \| \overline{A B}$.

Finally from $\triangle B A T \sim \triangle A^{\prime} A C$, we get

$$
\frac{A X}{X B}=\frac{A Z}{Z B}=\frac{B A^{\prime}}{A A^{\prime}}=\frac{A C}{A A^{\prime}}=\frac{A T}{A B} .
$$

Since

$$
\measuredangle A P Y=\measuredangle Y A P=\measuredangle Y A B=\measuredangle A C B=\measuredangle A X B=\measuredangle A X Y
$$

we get $Y X P A$ is cyclic and hence

$$
B P \cdot B A=B X \cdot B Y=B X \cdot \frac{A B \cdot A Y}{A X}
$$

with the last equality due to $\triangle B Y A \sim \triangle A Y X$. Meanwhile,

$$
A Q=\frac{A Y}{A T} \cdot A F=\frac{A Y}{A T} \cdot A B
$$

Combining with the main claim, we have $A Q=B P$ as needed.
